CHAPTER III
RESEARCH METHOD

This chapter discussed sources of data, subject and setting of research, research design, research variable, instruments, and procedures of experimentation, scoring technique, and method of data analysis.

A. RESEARCH DESIGN

Research design played an important role in a research because the quality of research greatly depended on the design. In this research, the writer used the form of quantitative approach to analyze the data. According to Michael J Wallace, “Quantitative is broadly used to describe what can be counted or measured and can therefore be considered objective”.1

1. Experimental Research

Experimental research is one of the most powerful research methodologies that researchers can use. Of many types of research that might be used, the experiment is the best way to establish cause-and-effect relationships among variables. Yet experiments are not always easy to conduct.2

An experimental research involved two groups: experimental group and control group. The experimental and control group are consisting of eight grade students of MTs.Negeri Kendal. An experimental group received a new treatment while control group received a usual treatment. According to Nunan, experiment is designed to collect data in such a way that threats to the

---

reliability and validity of the research are ministered. This study used pre-test and post-test.

The design of the experiment could be described as follows:

\[
\begin{array}{c}
E_01 & X & 02 \\
C_03 & Y & 04 \\
\end{array}
\]

Adopted from Arikunto.

Where:

\begin{align*}
E & = \text{experimental group} \\
C & = \text{control group} \\
01 & = \text{pre-test for experimental group} \\
02 & = \text{post test for experimental group} \\
03 & = \text{pre-test for control group} \\
04 & = \text{post test for control group} \\
X & = \text{treatment by using role play} \\
Y & = \text{treatment without using role play}
\end{align*}

From the design above, subjects of research were grouped into an experimental group (top line) and a control group (bottom line). The quality of subjects was first checked by pre-testing them (01 and 03). Then, the experimental treatment (taught by using role play) was applied to the experimental group, while the control group was taught without role play. The test was held in the form of conversation. The results of post-test (02 and 04) were then computed statistically.

Activities should be conducted in experimental and control class as follows:

---

1. **The Activities of Experimental Group**

   a). Pre-test

   Pre-test was given before the treatments. First, the writer came to the class. Then, he explained to the students what they had to do. Finally, she distributed the instruments and asked them to do the test.

   b). Activities in Experimental Group

   There were some activities in experimental group (Class VIII A) as follows:

<table>
<thead>
<tr>
<th>No</th>
<th>Activities</th>
<th>Time Allotment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1) Teacher explains about 3 expressions that should be learned by the students in this semester. (Asking and giving or refusing services, asking and giving information, and asking and giving opinion)  &lt;br&gt; 2) Teacher invites students to make some expressions.  &lt;br&gt; 3) Teacher asks students to work in pair and asks them to make a dialogue using those three expressions. (under teacher controlled).</td>
<td>3x45’</td>
</tr>
<tr>
<td>2</td>
<td>1) Teacher distributes the sheets of situations.  &lt;br&gt; 2) Teacher asks students to work in pair and asks them to make a conversation based on the situation given.</td>
<td>2x45’</td>
</tr>
<tr>
<td>3</td>
<td>1) Teacher distributes the sheets of situations.  &lt;br&gt; 2) Teacher asks students to work in pair and asks them to make a conversation based on the situation given.</td>
<td>2x45’</td>
</tr>
</tbody>
</table>
b) Post-test

Post-test was held after all treatments were conducted. This test was used to measure students’ achievement after they were given treatments. The result of test was analyzed statistically.

2. The Activities of Control Group
   a) Pre-test

Pre-test was given before the treatment. First, the writer came to the class. Then, he explained to the students what they had to do. Finally, he distributed the instruments and asked them to do the test.

b) Activities for control group

There were some activities in control group (class VIII B) as follows:

<table>
<thead>
<tr>
<th>No</th>
<th>Activities</th>
<th>Time Allotment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1) Teacher explains about 3 expressions that should be learned by the students in this semester. (Asking and giving or refusing services, asking and giving information, and asking and giving opinion) 2) Teacher invites students to make some expressions.</td>
<td>3x45’</td>
</tr>
<tr>
<td>2</td>
<td>1) Teacher explains how to make expression of asking and giving services and information 2) Teacher makes some Indonesian expressions (asking and giving services and information) and asks all of students to say it in English one by one.</td>
<td>2x45’</td>
</tr>
</tbody>
</table>
3.  
1) Teacher explains how to make expression of asking and giving opinion  
2) Teacher makes some Indonesian expressions (asking and giving services and information) and asks all of students to say it in English one by one.  

2x45’

c) Post-test  
Post-test was held after all treatments were conducted. This test was used to measure students’ ability after they were given treatments. The result of test was analyzed statistically

B. THE SUBJECT OF THE RESEARCH

This study was conducted in MTs. Negeri Kendal located at Jalan Islamic Center Bugangin Kendal Po Box 140. The subjects of this study were the eight grade students of MTs. Negeri Kendal in 2009/2010 academic year. This study was conducted in second semester. Due to limitation of time, the writer did not take all students as the subjects of the study, but drew a sample.

1. Population

Population can be defined as a group to whom the researcher would like to generalize the result of the study. The population of the research was the eight grade students of MTs Negeri Kendal in the academic year of 2009/2010 which consisting of seven class. Each class consists of forty one and forty students. The total population was 282 students.

2. Sample

A sample is a group in research study on which information is obtained. Because the population of the study is very big, the researcher did not take all the subject of the population. The researcher took some subjects from the population. The research is an experimental research, so the researcher needs

---

to take two classes that will be an experimental and control class as the sample from seven classes of the population. To determine the two classes, the researcher used purposive sampling technique. This technique was done by taking the subject/sample which is not based on strata, random or area but it is based on the consideration of a certain purpose. The consideration that the researcher tried to complete in preliminary research was the sample that will be chosen has to be homogeny, so that the research will be a good and valid research. Because we know that something that can be compared is something that has the similar characteristic. The researcher took class VIII A and VIII B, because based on the result of the summative test of the first semester, these two classes gained similar average achievements and considered as homogeneous class. Each class consisted of 40 students. Students in class VIII A was taught by using role play and considered as experimental group. While students in class VIII B was taught without using role play and considered as control group.

C. RESEARCH VARIABLES

According to Fred D. Kerlinger as cited by Arikunto, that all experiments have one fundamental idea behind them; to test the effect of one or more independent variables on a dependent variable (it is possible to have more than one dependent variable in experiments).

This research, that used role as method in teaching transactional and interpersonal text, had two variables. Those variables were:

1. The independent variable

Independent variable is the variable that the experimenter changes within a defined range; it is the variable in whose effect the experimenter is interested. The independent variable of this research was the use of role play in teaching transactional and interpersonal text.

---

6 Suharsimi Arikunto, Op.Cit., p. 139
7 Suharsimi Arikunto, op.cit., p. 119.
8 Larry B. Christensen, Experimental Methodology, (Massachusetts:University of South Alabama,2001), 8th Ed, p. 145.
2. The dependent variable

Dependent variable is variable that measures the influence of the independent variable. The dependent variable of this study was the students’ achievement in the speaking test score in transactional and interpersonal text.

D. TIME AND SETTING

This research was conducted on the second semester in the academic year of 2009/2010 for about 1 month began from March up to April 2010. It was conducted in MTs. Negeri Kendal, which was located on Jalan Islamic center, Bugangin, Kendal.

E. METHODS OF DATA COLLECTION AND ANALYSIS

1. Source of Data

The data of this research were gathered from the oral test of students’ in pre-test and post-test through ‘role play in transactional and interpersonal conversation’ and the documentation of students’ previous summative test score.

2. Success Indicators

The indicators of speaking teaching learning are as follow:

a. The improvement of students’ transactional skill through the use of ‘role play’.

b. Students’ speaking achievement with the minimum standard of score (KKM) speaking 6.0

---

*Ibid.,* p. 145
3. Methods of collecting data

1. Test

Test is a set of questions and exercises used to measure the achievement or capacity of the individual or group. In order to discover how students are thinking and using the target language (English). The researcher will conduct oral test in role play technique. The form of the test was direct test item of speaking because the writer put the students in pairs and asked them to perform a role play based on the topic given. The topic was “asking information, asking someone services, and asking someone opinion”. The writer analyzed the result of the test and gave score. Harmer states that a test item is direct if it asks candidates to perform the communicative skill which is being test. The test will be conducted to both control class and experimental class which consist of 40 students of control class and 40 students of experiment class in form of speaking transactional and interpersonal text to evaluate students' speaking before and after the treatment. The scoring system will pay attention to the four aspects of speaking scoring; grammar and vocabulary, discourse management, pronunciation, and interactive communication.

Test is used to measure the person’s competence and to achieve the objective. The data was collected by giving speaking test. Speaking was conducted twice, there are pre-test and post-test. The form of the test is direct speaking test and the teacher gave scores on pronunciation, grammar, vocabulary, fluency, and comprehension.

2. Documentation

Another data is needed to help the researcher run the research. In addition to do that, data will be collected through documentation of the

---

students’ previous examination score from the school. It will be used to validate the sample.

Documentation of students’ speaking test recording is used to evaluate students’ speaking skill.

### 4. Scoring Technique

In each test, the students played role play in transactional and interpersonal conversation. The topic of the role play was “asking and giving information, asking and giving someone services, and asking and giving someone opinion”. The researcher gave speaking test to the students to analyze their scores on pronunciation, grammar, vocabulary, fluency, and comprehension.

In giving scores to the students, the writer used analytic scale which categorized by some categories and the writer follows these scoring criteria for each category. This analytic score has five items and each item scores five. So, the maximum score is 25. But it will be multiplied with 4, so the final maximum score will be 100.

Analytic scoring of speaking could be seen on the following figures:

<table>
<thead>
<tr>
<th>Aspects</th>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pronunciation</strong></td>
<td>5</td>
<td>Have few traces of foreign accent.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Always intelligible, though one is conscious of a definite accent</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Pronunciation problem necessitate concentrated listening and occasionally lead to misunderstanding.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Very hard to understand because of pronunciation problems, must frequently be asked to repeat.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Pronunciation problems so severe as to make</td>
</tr>
<tr>
<td></td>
<td>Speech virtually unintelligible.</td>
<td></td>
</tr>
<tr>
<td>-----</td>
<td>---------------------------------</td>
<td></td>
</tr>
<tr>
<td><strong>Grammar</strong></td>
<td>5</td>
<td>Makes few (if any) noticeable errors of grammar and word order.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Occasionally makes grammatical and/or word order errors which do not, however obscure the meaning.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Make frequent errors of grammar and word order which occasionally obscure meaning.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Grammar and word order errors make comprehension difficult. Must often rephrase sentences and/or restrict himself to basic patterns.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Errors in grammar and word order so severe as to make speech virtually unintelligible.</td>
</tr>
<tr>
<td><strong>Vocabulary</strong></td>
<td>5</td>
<td>Use of vocabulary and idioms is virtually that of a native speaker.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Sometimes uses inappropriate terms and/or must rephrase the idea because of lexical inadequate</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Frequently uses the wrong words; conversation somewhat limited because of inadequate vocabulary.</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Misuse of word and very limited vocabulary make comprehension quite difficult.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Vocabulary limitations so extreme as to make conversation virtually impossible.</td>
</tr>
<tr>
<td><strong>Fluency</strong></td>
<td>5</td>
<td>Speed as fluent and effortless as that of a native speaker.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Speed of the speech seems to be slightly affected by language problem.</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Speed and fluency are rather strongly affected by</td>
</tr>
</tbody>
</table>
### Language Problems

<table>
<thead>
<tr>
<th>Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Appears to understand everything without difficulty.</td>
</tr>
<tr>
<td>4</td>
<td>Understand nearly everything at normal speed, although occasional repetition may be necessary.</td>
</tr>
<tr>
<td>3</td>
<td>Understand most of what is said at slower than normal speed with repetition.</td>
</tr>
<tr>
<td>2</td>
<td>Has great difficulty following what is said. Can comprehend only “social conversation” spoken slowly with frequently repetitions.</td>
</tr>
<tr>
<td>1</td>
<td>Can not be said to understand even simple conversation virtually impossible.</td>
</tr>
</tbody>
</table>

**Comprehension**

Based on “Testing English as a Second Language”

### 5. Methods of Data Analysis

There are three kinds of test that will be held in experimental research, they are pre-requisite test, try-out test, and hypothesis test. So there must be three process of analyzing the data collected from test.

#### 1. Pre-requisite Test

Before the writer determines the sample, the writer should conduct a homogeneity test by choosing 2 classes with cluster random sampling. This test conducted to determine whether the data are homogenous or not. After conducted the test, data analysis was carried out to find out the

---

homogeneity of the sample. It was meant to check if the research result met the requirement of good research or not.

It was meant to get the assumption that sample of research came from a same condition or homogenous. The writer used the formula as follows:

\[ F = \frac{\text{Biggest Variance}}{\text{Smallest Variance}} \]

Cited from Sugiono.\textsuperscript{12}

2. **Try out Test**

According to Mouly in Tiowati, a try out test is necessary since the result will be used to make sure that the measuring instrument has such characteristics as validity and reliability.\textsuperscript{13} The instrument to be tried out was the composition test. The result of test was used to find out the validity and reliability.

1. **Validity**

Heaton states that validity is the extent to which it measures what is supposed to measure and nothing else.\textsuperscript{14} The result was consulted to critical score for r-product moment. If the obtained coefficient of correlation was higher than the critical score for r-product moment, it meant that a paragraph was valid at 5% alpha level significance.

\textsuperscript{13}Husni Mubarok, *The Effectiveness of Animated Film as Media in the Teaching of Narrative Writing (An Experimental Research at the Tenth Grade Students of MA Futuhiyyah 2 Demak in 2009/2010 Academic Year)*. (Semarang: IAIN Walisongo, 2009), p. 32.

To calculate the validity, the writer used the formula as follows:

\[ r_{xy} = \frac{N \sum XY - (\sum X)(\sum Y)}{\sqrt{[N \sum X^2 - (\sum X)^2][N \sum Y^2 - (\sum Y)^2]}} \]

Cited from Arikunto.\(^{15}\)

Where:

- \( r_{xy} \) = the correlation of the scores on two halves of the test
- \( N \) = the number of the students in each group
- \( X \) = the score of each component of speaking scoring
- \( Y \) = the sum of all dialogue’s score
- \( \sum X \) = the sum of total X score in each group
- \( \sum Y \) = the sum of total score from each student
- \( \sum XY \) = the sum of multiple score from each student with the total score
- \( \sum X^2 \) = the sum of the square score in each component of speaking
- \( \sum Y^2 \) = the sum of all dialogue’s score square

2. Reliability

Reliability refers to the stability or the consistency of the test scores. Heaton states that reliability is a necessary characteristic of any good test; for it to be valid at all, a test must first be reliable as a measuring instrument.\(^{16}\) In this study, the reliability of the test was measured by comparing the obtained score with r-score product moment. Thus, if the obtained score was higher than the table r-score, it could be said that the test was reliable.

\(^{15}\)Suharsimi Arikunto, *op.cit.*, p. 170.

\(^{16}\)J. B. Heaton, *op.cit.*, p.155.
To calculate the reliability of the test, the writer used the formula as follows:

$$r_{11} = \left( \frac{k}{k-1} \right) \left( 1 - \frac{\sum \sigma_{b2}}{\sigma_t^2} \right)$$

Cited from Arikunto.  

Where:

- $r_{11}$ = index reliability
- $k$ = number of items
- $\sum \sigma_{b2}$ = items variance
- $\sigma_t$ = total variance

To find out the variance of each item, the formula was:

$$\sigma_{b}^2 = \frac{\sum X^2 - (\Sigma X)^2}{N}$$

To find out the total variance, the formula was:

$$\sigma_{t}^2 = \frac{\sum Y^2 - (\bar{Y})^2}{N}$$

3. Item Analysis

After scoring the try-out test, item analysis was carried out to find out the effectiveness of the items. It was meant to check whether each item met the requirement of good test item or not. Item analysis discussed two main things:

1) Difficulty Level

Heaton states that “the index of difficulty of an item simply shows how easy or difficult the particular item proved in the test.”  

---

\(^{17}\)Suharsimi Arikunto, *op.cit.*, p. 196.
If a teacher knows deeply about item difficulty in making a test, he can make his test easy, medium, or difficult.

To know the item difficulty, the writer used the formula:

\[ P = \frac{B}{JS} \]

Where:

- \( P \) = index of difficulty
- \( B \) = the number of students who answer an item correctly
- \( JS \) = the total number of students

The index of difficulty level can be classified as follows:

- \( 0.00 \leq P < 0.30 \) is difficult
- \( 0.30 \leq P < 0.70 \) is medium
- \( 0.70 \leq P < 1.00 \) is easy

Cited from Sukestiyarno and Wardono.\(^{19}\)

2) Discriminating Power

Item of discrimination power tells how well the item performs in separating the better students from the poorer students. If the good students tend to do well on an item and the poor students do badly on the same item, then the item is a good one because it distinguishes the good students from the bad students. Heaton states, “The discrimination index of an item indicated the extent to which the item discriminated between the testee, separating the more able testee from the less able. The index of discriminating power told us if students who perform well on the whole test tended to do well or badly on each item in the test.”\(^{20}\)

\(^{18}\)J. B. Heaton, *op.cit.*, p.172.
\(^{19}\)Sukestiyarno and Wardono, *Statistika*, (Semarang: UNNES Press, 2009), p. 63..
To calculate the index of discriminating power, the writer used the formula:

\[
D = \frac{B_A}{J_A} - \frac{B_B}{J_B} = P_A - P_B
\]

Taken from Arikunto.\textsuperscript{21}

Where:

- \(J_A\) = Number of all students in the upper group
- \(J_B\) = Number of all students in the lower group
- \(B_A\) = Number of students in the upper group who answered the item correctly
- \(B_B\) = Number of students in the lower group who answered the item correctly
- \(P_A\) = The proportion of the upper group who answered the item correctly
- \(P_B\) = The proportion of the upper group who answered the item correctly

The criteria of determining the index of discriminating are below:

- \(D = 0.00 – 0.20\) : Poor
- \(D = 0.21 – 0.40\) : Satisfactory
- \(D = 0.41 – 0.70\) : Good
- \(D = 0.71 – 1.00\) : Excellent

3. Hypothesis Test

Firstly, the test was done in both groups, experimental and control group. Secondly, the result of the test was scored by using analytic scale. Thirdly, the means score of the two groups were determined. Finally, the two means were compared by applying t-test formula. T-test was used to

differentiate if the students’ result of students’ speaking skill in transactional and interpersonal text by using role play and without using role play was significant or not.

\[
t = \frac{x_1 - x_2}{s \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}}
\]

Where:

\[
s = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}
\]

Cited from Sudjana.\(^{22}\)

Where:

\[
x_1 = \text{the mean score of the experimental group}
\]

\[
x_2 = \text{the mean score of control group}
\]

\[
n_1 = \text{the number of the experimental group}
\]

\[
n_2 = \text{the number of the control group}
\]

\[
s = \text{standard deviation}
\]

\[
s^2 = \text{variance}
\]

If the obtained score was higher than t-table score by using 5% alpha of significance, \(H_0\) was rejected. It meant that \(H_a\) was accepted: “There was a significant difference in speaking achievement between the experimental and control group.”

---
